

OFFICIAL ZEYVRO MODULE

n8n Connector for PrestaShop 8

Installation & configuration guide

v1.3.0

zeyvro.com edition

✓ Tested on PS 8.1-9.1

✓ One-time lifetime payment

✓ Signed webhooks (HMAC)

✓ Made in the EU

This module sends your PrestaShop store events —orders, customers, products, stock and carts— to n8n via **signed webhooks**, ready to use in your automations. This guide takes you from install to your first successful test.

IN THIS GUIDE

- | | |
|-----------------------------|--|
| 1 Requirements | 6 Test the connection |
| 2 Installation | 7 Receive actions from n8n (inbound webhook) |
| 3 Activate your license | 8 Send log |
| 4 General configuration | 9 Support |
| 5 Choose the events to send | |

1 Requirements

- PrestaShop **8.1 or higher** (compatible up to 9.1), with **PHP 8.1 or higher**.
- An n8n instance to receive the events: n8n cloud or self-hosted (on your own server).
- The module file: [zeyvro_n8nconnector-1.3.0.zip](#).

2 Installation

- In the BackOffice, go to **Modules → Module Manager → Upload a module**.
- Drag the module ZIP and click **Install**.
- It then appears under the **Zeyvro → n8n Connector** side menu.

3 Activate your license

Open **Zeyvro → n8n Connector**. In the «**License**» panel, paste the key you received by email when buying and click «**Activate license**». The module validates it against LemonSqueezy.

- You get a **7-day trial** from install to set everything up.
- If your server loses connection temporarily, there is a **14-day grace period** with an active license.
- You can free an activation for another store with «**Deactivate license**».

4 General configuration

Open **Zeyvro → n8n Connector → Configuration**. Tick «Enable module» and paste your n8n Webhook node URL (the *Production URL*, like <https://your-n8n/webhook/...>). Optionally add a static token and adjust the retries.

General settings

☒ **Enable module**
If disabled, no events are sent to n8n.

n8n Webhook URL

Webhook node URL in your n8n workflow.

Static token (optional)

If set, each delivery adds the X-Webhook-Token header with this value (plus the HMAC X-Zeyvro-Signature).

Retries on failure

Retries with exponential backoff (1s, 2s, 4s...)

☒ **Save delivery log**
Records each delivery (payload, response and status) viewable in "View logs".

Module configuration panel in the BackOffice.

5 Choose the events to send

Under «Active events» tick which store changes you want to send to n8n. Enable only the ones you need.

Active events

Select the store events that will be sent to the n8n webhook.

☒ New order hook: actionValidateOrder	☒ Order status changed hook: actionOrderStatusUpdate	☒ New customer registered hook: actionCustomerAccountAdd	☒ Customer updated hook: actionObjectCustomerUpdateAfter
☒ New product created hook: actionObjectProductAddAfter	☒ Product updated hook: actionObjectProductUpdateAfter	☒ Stock update hook: actionUpdateQuantity	☒ Cart updated hook: actionCartSave

The 8 available events: new order, status change, new/updated customer, new/updated product, stock and cart.

6 Test the connection

- Make sure your n8n workflow is **active** (published) and the Webhook node method is **POST**.
- Click «**Send test webhook**». It must return **HTTP 200**.
- In n8n, check under «Executions» that the run arrived.

7 Receive actions from n8n (inbound webhook)

The module can also receive actions from n8n into your store. Each request must be signed with the `X-Zeyvro-Signature` header (HMAC-SHA256). Available actions:

- `ping` connectivity test.
- `update_stock` update a product's stock.
- `update_order_status` change an order's status.
- `create_customer` create a customer.
- `get_order` fetch an order.

8 Send log

Under «View logs» you have the history of each webhook sent (event, HTTP code, retries, status and date), with stats and manual resend.
